

## The Power of Apex Mobile

Apex Mobile brings you not only the information you need, when you need it, but more importantly where you need it. Whether on the road, at the office or even at a site, you can connect to your full Apex network to view and control all your critical assets within seconds.

## Network visibility in the palm of your hand

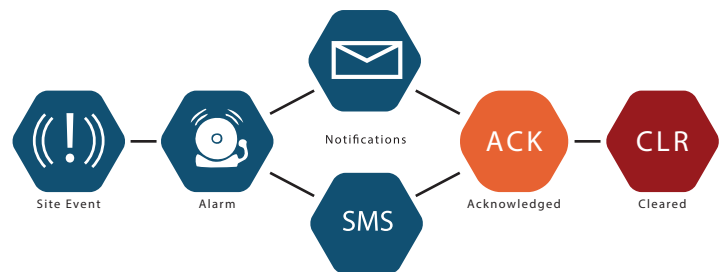

With Apex Mobile, every data point on your entire monitoring network is available to you whenever and wherever you want it to be. By utilizing existing Apex event and alarm notifications (Email and SMS), Apex Mobile allows the user system or device level visibility with a single tap.

From either screen, the user can quickly acknowledge and or clear alarms as required. In addition to managing alarms, Apex Mobile gives users the ability to manually trigger site outputs. This not only gives an unmatched level of control, but assists in site troubleshooting.

## Setup and Security

Setting up Apex Mobile could not be easier. Included with Apex are all the components required to get Apex Mobile up and running. Once installed, your network will be available on any web enabled phone, tablet, or device.

Knowing that security is of the utmost importance to our customers, we designed Apex Mobile from the ground up to take care of all possible security concerns. Apex Mobile and the Apex server do this in two ways. Because Apex Mobile is hosted on your own equipment, there is no question where your data is stored and who is managing it. Second, by using secure web authentication methods, you not only have granular control over who is able to view your data, but also what each user can see or control at all levels.

Access to your entire system when you need it,  
where you want it...
